MULTI-STEP AI WORKFLOW

Assessment Submission

Scenario: AI Study Planner — From Student Requirements to a Refined Personalized Plan

Student Name	Rohith M
Registration Number	99230040751
Email	rohithn2006@gmail.com
Department	CSE-AIML
Assessment Format	Chained multi-prompt AI workflow

Assessment Format	Chained multi-prompt AI workflow

Submission Note

This document presents a complete three-stage chained workflow. Each stage explicitly depends on the output of the previous stage, and the final stage includes a self-critique gate before producing the refined answer.

Font: Times New Roman-compatible serif formatting throughout the document.

1. Assessment Understanding & Workflow Design

The provided assessment rules require a multi-stage task with at least three distinct prompts in the same chat session. The prompts must be chained, meaning each later prompt must use, critique, or transform the previous output. At least one step must act as a critique/refinement gate, and the submission must document the prompt transcript and intermediate responses. fileciteturn0file1L5-L12

The reference example demonstrates a clear progression: planning first, drafting second, and evaluation/refinement third. fileciteturn0file0L6-L18

Selected Scenario

AI Study Planner: Convert a student's academic constraints into a practical weekly study plan, generate a detailed schedule from that plan, then audit and improve the schedule against explicit criteria.

Stage	Purpose	Input	Output
1 — Planning	Extract priorities, constraints and planning rules.	Student requirements	Structured study-plan blueprint
2 — Generation	Turn the blueprint into a usable weekly timetable.	Stage 1 blueprint	Detailed weekly schedule
3 — Critique & Refinement	Audit the schedule and correct weaknesses.	Stage 2 schedule + checklist	Critique + final refined schedule

Why this scenario is suitable

It is naturally multi-stage: a good timetable should not be generated blindly. The first stage identifies what matters, the second operationalizes those decisions, and the third checks whether the result is balanced, realistic and complete. This creates a visible dependency between all three prompts rather than three unrelated questions.

2. Exact Prompt Chain Transcript

The following are the exact prompts used for the three-stage workflow. The wording intentionally makes the dependency explicit.

Prompt 1 — Extraction & Planning

Act as an expert academic planning assistant. I am Rohith M , a CSE-AIML student preparing for multiple subjects and technical interviews. I have 7 days available. My priorities are: Java programming, SQL/DBMS, DSA, AI/ML fundamentals, and project work. I can study about 4 focused hours on weekdays and 6 hours on the weekend. I prefer shorter sessions with breaks and I want daily revision rather than leaving revision to the final day.

Task: Extract the important requirements, identify priorities, create a structured weekly planning blueprint, and assign a reasonable time allocation to each area. Do not create the final timetable yet. Your output must be organized as a table followed by 4–6 planning rules that can be directly used in the next prompt.

Prompt 2 — Generation / Drafting

Using only the planning blueprint and planning rules produced in Step 1, create the first draft of a 7-day study timetable. Preserve the priorities and time allocations from Step 1.

Constraints: 4 focused hours Monday–Friday and 6 focused hours Saturday–Sunday; include breaks between sessions; include daily revision; give every listed subject a place; keep sessions practical rather than overly long; include a small buffer for project work. Present the result as a day-by-day table with time blocks and a short explanation of the strategy.

Prompt 3 — Critique Gate & Refinement

Before finalizing the timetable, act as a strict academic reviewer. Review the Step 2 draft against this checklist: (1) weekday/weekend hour limits are respected, (2) all five priority areas receive meaningful time, (3) every day contains revision, (4) sessions are not excessively long, (5) project work has a realistic buffer, and (6) the sequence supports learning rather than random topic switching.

First, list any failures or weak points and explain the correction. Second, output the complete corrected timetable. Do not remove useful content unless necessary; improve the existing Step 2 schedule using the checklist.

3. Intermediate AI Responses

Step 1 Output — Planning Blueprint

Area	Priority	Weekly Focus	Planning Rule
Java	High	7–8 hrs	Practice code daily; increase difficulty gradually.
DSA	High	6–7 hrs	Combine concept review with problem solving.
SQL / DBMS	High	5–6 hrs	Alternate SQL practice and DBMS concepts.
AI / ML	Medium	4–5 hrs	Use concept → example → short recall pattern.
Project	Medium	3–4 hrs	Keep a small, protected buffer instead of one large block.

Planning rules generated by Step 1: (1) Put the hardest technical work earlier in the day. (2) Use 50–60 minute focus blocks with short breaks. (3) End each day with active recall or revision. (4) Avoid stacking similar difficult topics for too long. (5) Keep project work in manageable blocks. (6) Use the weekend for deeper problem solving and consolidation.

Step 2 Output — First Draft Schedule

Day	Focus Blocks	Revision / Buffer
Mon	Java practice • DSA concepts • SQL practice • AI/ML basics	20 min Java + SQL recall
Tue	DSA problems • Java OOP • DBMS concepts • Project	20 min DSA recall
Wed	SQL queries • Java coding • AI/ML concepts • DSA problems	20 min mixed recall
Thu	DSA problems • DBMS • Java coding • Project	20 min Java/DBMS recall
Fri	Java interview practice • SQL • AI/ML • DSA	20 min weekly weak-area recall
Sat	Deep DSA • Java project coding • SQL/DBMS • AI/ML	30 min revision + project buffer
Sun	Mock coding • SQL test • AI/ML review • Project • Weekly recap	Final weekly review + next-week notes

4. Critique Gate & Final Refined Output

Step 3 Self-Critique

Checklist	Review	Action
Hour limits	The draft is close, but revision blocks need to be counted separately to avoid exceeding the focused-hour target.	Treat revision as part of the daily focus allocation and keep total focused study within the stated limit.
All priority areas	All five areas appear, but project work is less consistent than the other areas.	Add a protected project block on two weekdays and one weekend block.
Daily revision	Revision is present every day.	Keep it, but use active recall rather than rereading.
Session length	The draft does not define exact block lengths.	Use 50-minute focus + 10-minute break cycles.
Learning sequence	The sequence is generally balanced but can better connect concepts to practice.	Place concept learning immediately before related practice where possible.

Final Corrected 7-Day Study Plan

Day	50-min Focus Sessions	10-min Breaks / End Review
Monday 4 hrs	1. Java coding 2. DSA concepts + 2 problems 3. SQL query practice 4. AI/ML fundamentals	Break after each session; final 20 min = active recall
Tuesday 4 hrs	1. DSA problems 2. Java OOP 3. DBMS concepts 4. Project implementation	Short breaks; final 20 min = DSA + DBMS recall
Wednesday 4 hrs	1. SQL practice 2. Java coding 3. AI/ML concepts + examples 4. DSA problems	Short breaks; final 20 min = mixed recall
Thursday 4 hrs	1. DSA problems 2. DBMS + SQL 3. Java interview questions 4. Project implementation	Short breaks; final 20 min = Java/DBMS recall
Friday 4 hrs	1. Java mock coding 2. SQL test 3. AI/ML revision 4. DSA timed practice	Short breaks; final 20 min = identify weak areas
Saturday 6 hrs	1. Deep DSA practice 2. Java problem set 3. SQL/DBMS test 4. AI/ML application 5. Project work 6. Weak-area repair	Break after each block; final 30 min = weekly consolidation

Day	50-min Focus Sessions	10-min Breaks / End Review
Sunday 6 hrs	1. Coding mock test 2. SQL/DBMS mock test 3. AI/ML review 4. Project completion 5. DSA revision 6. Weekly recap + next-week planning	Break after each block; final 30 min = recall + plan

Refinement result: The final schedule retains the original Step 1 priorities, converts them into concrete sessions, adds protected project time, uses consistent focus cycles, and makes daily revision explicit. This demonstrates the required evaluation-and-refinement gate.

5. Documentation, Dependency Check & Submission Evidence

The assessment asks students to compile the exact prompt chain, intermediate AI responses, and direct evidence such as a chat link or screenshot. fileciteturn0file1L31-L35

Dependency Verification

Requirement	How this submission satisfies it
At least 3 chained prompts	Three prompts are included: planning → generation → critique/refinement.
Explicit dependency	Prompt 2 instructs the model to use only the Step 1 blueprint; Prompt 3 audits and improves the Step 2 draft.
Critique gate	Prompt 3 contains six explicit checklist criteria and requires critique before the corrected final schedule.
Intermediate outputs	Step 1 planning output and Step 2 draft are documented before the final result.
Originality / live execution	The workflow is designed for sequential execution in the assigned AI interface; live evidence should be captured from that interface.
Submission evidence	Prompt transcript and outputs are documented here. A screenshot or chat link from the live AI session should be attached if the evaluator strictly requires direct UI evidence.

Live Evidence Placeholder

Paste the live AI-chat screenshot here

Live Evidence Mapping

The appendix contains the actual screenshots captured during the three-stage workflow execution.

The evidence is arranged in the same sequential order required by the assessment.

Prompt 1 — Extraction & Planning

Student requirements are converted into priorities, time allocations, and planning rules.

Prompt 2 — Generation / Drafting

The Step 1 blueprint is used to generate the first detailed 7-day timetable.

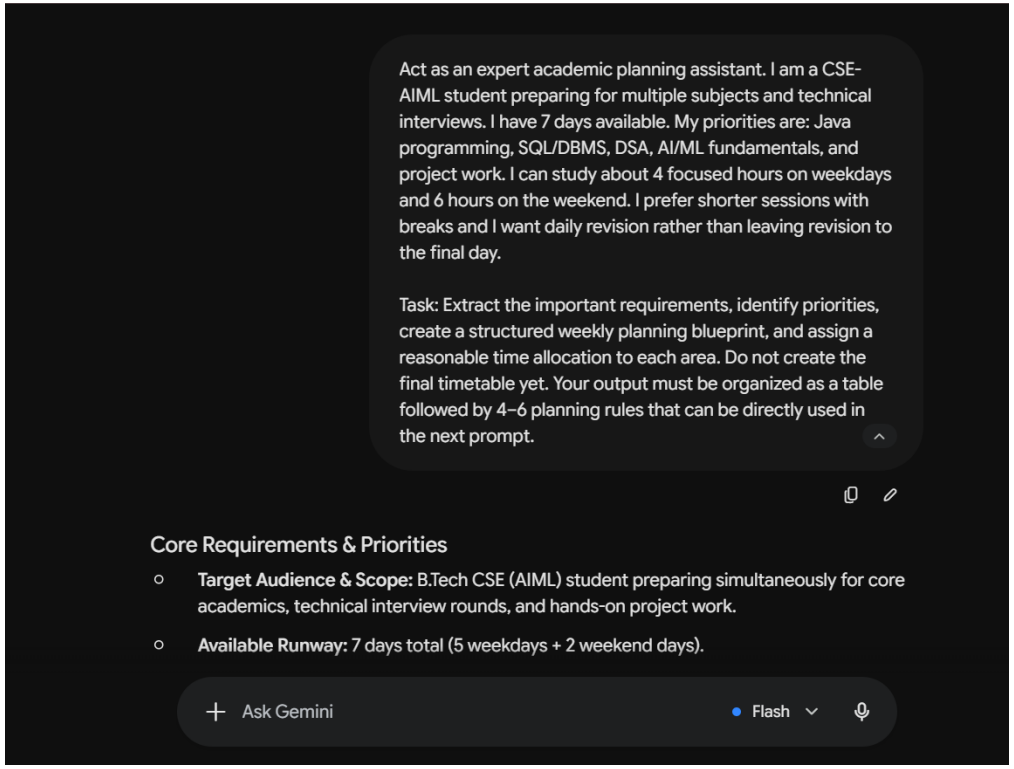

Prompt 3 — Critique & Refinement

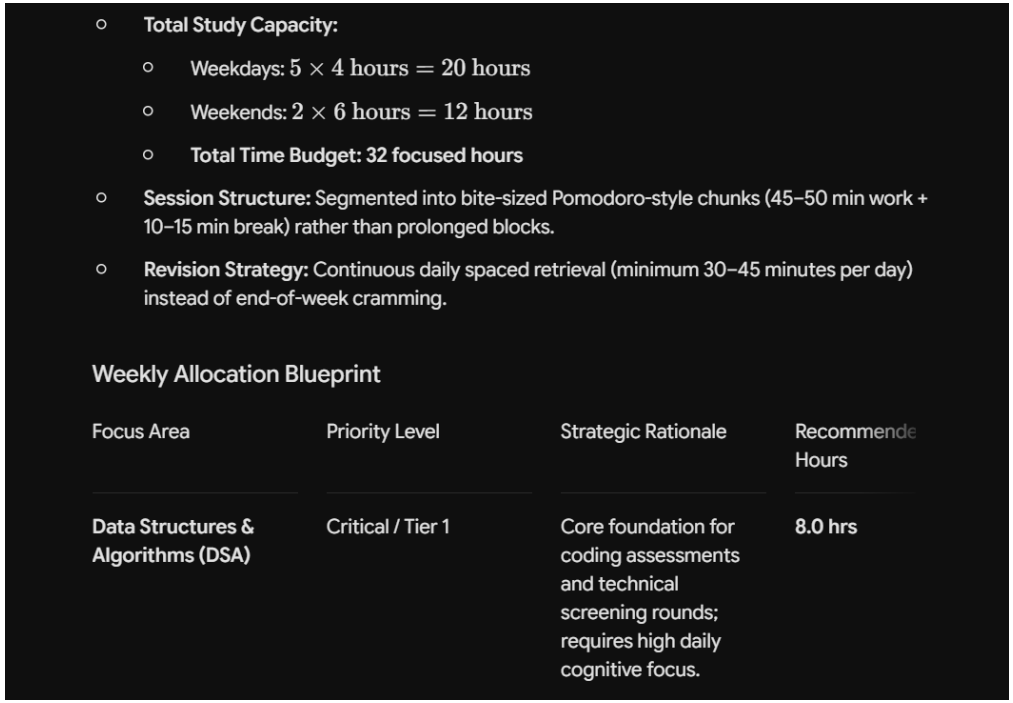

The Step 2 timetable is audited against six criteria and refined into the final schedule.

Evidence sequence

Prompt 1 → Response 1 → Prompt 2 → Response 2 → Prompt 3 → Critique → Final refined response.

All screenshots are preserved as live-interface evidence in the appendix.

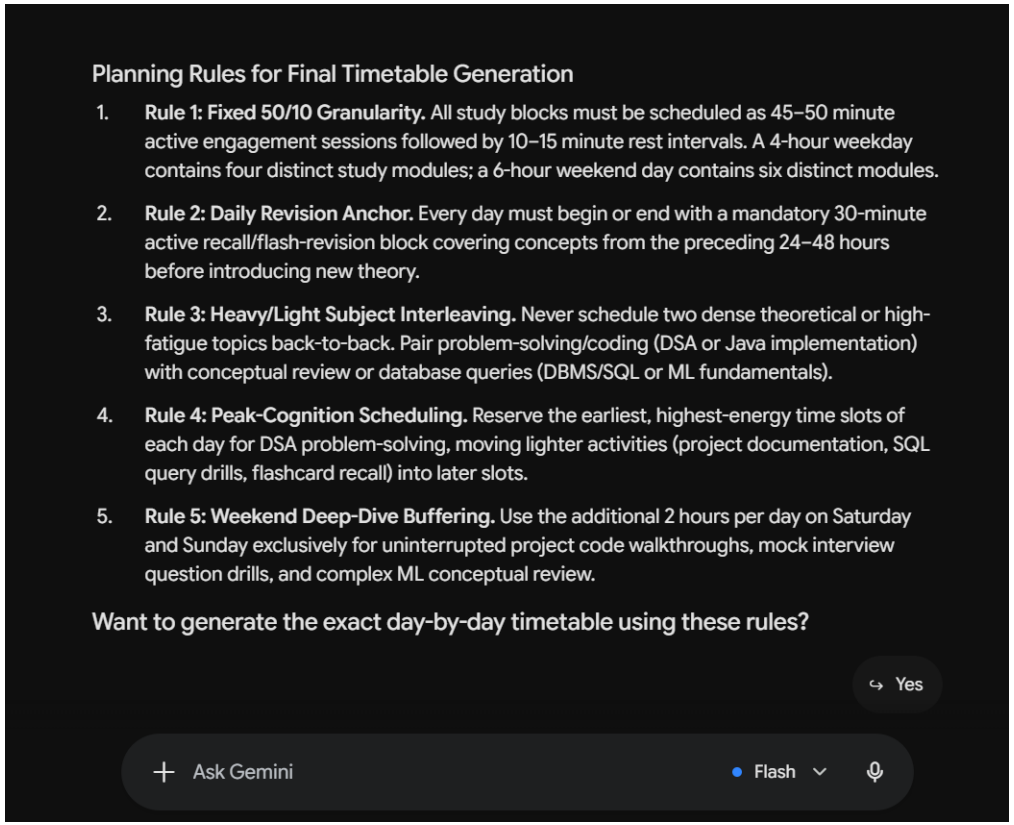

Act as an expert academic planning assistant. I am a CSE-AIML student preparing for multiple subjects and technical interviews. I have 7 days available. My priorities are: Java programming, SQL/DBMS, DSA, AI/ML fundamentals, and project work. I can study about 4 focused hours on weekdays and 6 hours on the weekend. I prefer shorter sessions with breaks and I want daily revision rather than leaving revision to the final day.
Task: Extract the important requirements, identify priorities, create a structured weekly planning blueprint, and assign a reasonable time allocation to each area. Do not create the final timetable yet. Your output must be organized as a table followed by 4–6 planning rules that can be directly used in the next prompt.
Core Requirements & Priorities
Target Audience & Scope: B.Tech CSE (AIML) student preparing simultaneously for core academics, technical interview rounds, and hands-on project work.
Available Runway: 7 days total (5 weekdays + 2 weekend days).

Planning Rules for Final Timetable Generation

1. **Rule 1: Fixed 50/10 Granularity.** All study blocks must be scheduled as 45–50 minute active engagement sessions followed by 10–15 minute rest intervals. A 4-hour weekday contains four distinct study modules; a 6-hour weekend day contains six distinct modules.
2. **Rule 2: Daily Revision Anchor.** Every day must begin or end with a mandatory 30-minute active recall/flash-revision block covering concepts from the preceding 24–48 hours before introducing new theory.
3. **Rule 3: Heavy/Light Subject Interleaving.** Never schedule two dense theoretical or high-fatigue topics back-to-back. Pair problem-solving/coding (DSA or Java implementation) with conceptual review or database queries (DBMS/SQL or ML fundamentals).
4. **Rule 4: Peak-Cognition Scheduling.** Reserve the earliest, highest-energy time slots of each day for DSA problem-solving, moving lighter activities (project documentation, SQL query drills, flashcard recall) into later slots.
5. **Rule 5: Weekend Deep-Dive Buffering.** Use the additional 2 hours per day on Saturday and Sunday exclusively for uninterrupted project code walkthroughs, mock interview question drills, and complex ML conceptual review.

Want to generate the exact day-by-day timetable using these rules?

Core Execution Guidelines

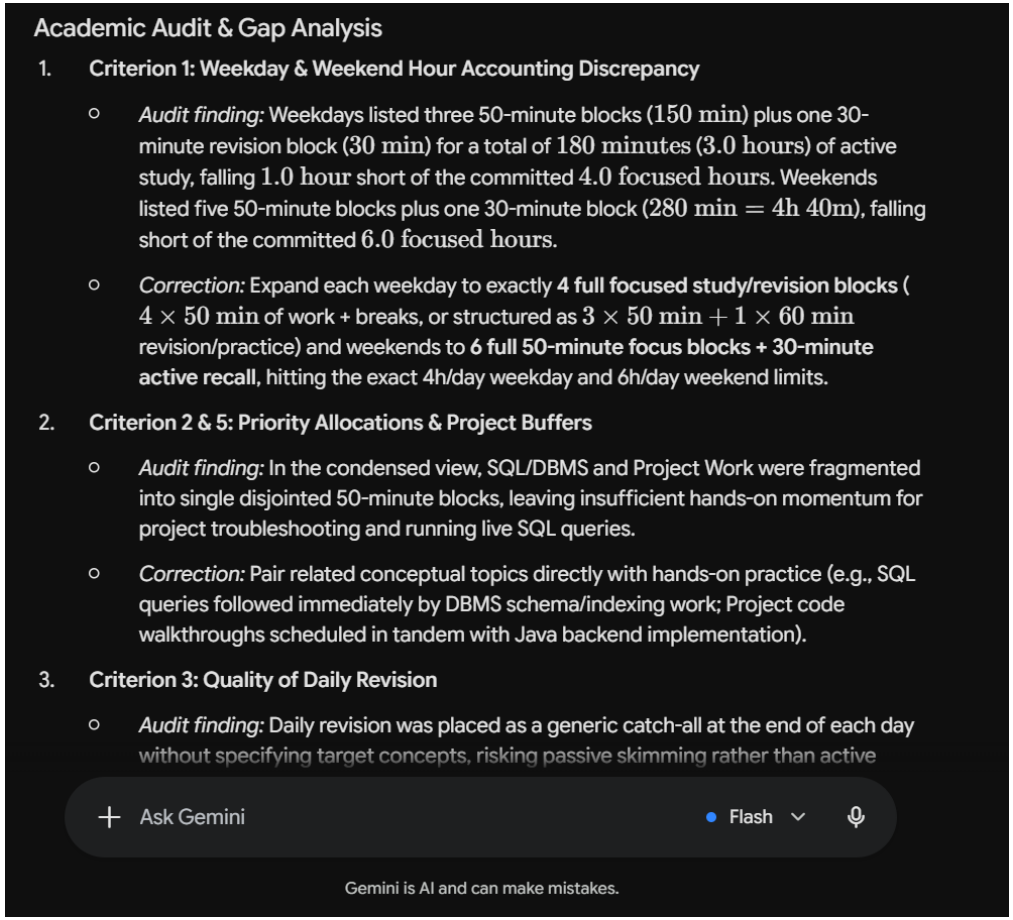

- **50/10 Cadence:** Every study item runs for 50 minutes of single-task focus followed by a strict 10-minute away-from-screen break.
- **Morning Anchor:** Complete the morning DSA and core programming blocks before checking messages or campus work to capture peak cognition.
- **Active Daily Revision:** Use the final 30 minutes solely for self-testing: sketch database schemas from memory, write core syntax on a blank sheet, and walk through algorithm edge cases out loud.

Want a 1-page quick reference sheet of the most asked DSA patterns and SQL queries?

Ask Gemini Flash

Gemini is AI and can make mistakes.

Before finalizing the timetable, act as a strict academic reviewer. Review the Step 2 draft against this checklist:
(1) weekday/weekend hour limits are respected,
(2) all five priority areas receive meaningful time,
(3) every day contains revision,
(4) sessions are not excessively long,
(5) project work has a realistic buffer, and
(6) the sequence supports learning rather than random topic switching.
First, list any failures or weak points and explain the correction. Second, output the complete corrected timetable.
Do not remove useful content unless necessary; improve the existing Step 2 schedule using the checklist.
Academic Audit & Gap Analysis
1. Criterion 1: Weekday & Weekend Hour Accounting Discrepancy
Audit finding: Weekdays listed three 50-minute blocks (150 min) plus one 30-
Ask Gemini

Gemini is AI and can make mistakes.

Academic Audit & Gap Analysis
1. Criterion 1: Weekday & Weekend Hour Accounting Discrepancy
Audit finding: Weekdays listed three 50-minute blocks (150 min) plus one 30-minute revision block (30 min) for a total of 180 minutes (3.0 hours) of active study, falling 1.0 hour short of the committed 4.0 focused hours. Weekends listed five 50-minute blocks plus one 30-minute block (280 min = 4h 40m), falling short of the committed 6.0 focused hours.
Correction: Expand each weekday to exactly 4 full focused study/revision blocks (4 × 50 min of work + breaks, or structured as 3 × 50 min + 1 × 60 min revision/practice) and weekends to 6 full 50-minute focus blocks + 30-minute active recall, hitting the exact 4h/day weekday and 6h/day weekend limits.
2. Criterion 2 & 5: Priority Allocations & Project Buffers
Audit finding: In the condensed view, SQL/DBMS and Project Work were fragmented into single disjointed 50-minute blocks, leaving insufficient hands-on momentum for project troubleshooting and running live SQL queries.
Correction: Pair related conceptual topics directly with hands-on practice (e.g., SQL queries followed immediately by DBMS schema/indexing work; Project code walkthroughs scheduled in tandem with Java backend implementation).
3. Criterion 3: Quality of Daily Revision
Audit finding: Daily revision was placed as a generic catch-all at the end of each day without specifying target concepts, risking passive skimming rather than active
Ask Gemini
Flash
Gemini is AI and can make mistakes.

- *Correction:* Anchor every daily revision block with an explicit target: 15 minutes of prior-day algorithmic re-derivation + 15 minutes of syntax/query drills.

4. **Criterion 4 & 6: Cognitive Sequencing & Session Length**
   - *Audit finding:* Sunday had four heavy conceptual/theoretical shifts back-to-back (DP → ML Ensembles → Streams → Indexing), causing cognitive context-switching fatigue.
   - *Correction:* Re-sequence topics chronologically and conceptually. Pair DSA tree traversals directly with graph/tree-based ML models, and pair SQL tuning directly with project database queries.

Corrected 7-Day Timetable (Exact 32 Focused Hours)

Every block represents **50 minutes of focused work followed by a 10-minute rest interval,** with a dedicated **30–40 minute active recall block** completing each day's exact hourly requirement.
